《Outline》 概略

Our water purification system is using EcoBio Block(EBB), block that contains Bacillus Natto together, with aerator(MFA). This biotreatment technology with useful microorganism decomposes organic matter and purifies water quality. This system is not only for water purification, but also is the system that increases diatom and relatively controls cyanobacteria(Blue-green algae) in lakes and marshes. This technology is developed with cooperation with Kyushu University Japan and Tongji University China. Tongji University is testing the real system of MFA.

水質浄化用納豆菌群を封入されたブロックと必要に応じて曝気装置（弊社製ＭＦＡ）を併用した浄化システム。有用微生物により有機物を積極的に分解し水質浄化を図る生物処理技術。同時に珪藻類の繁殖を促し、相対的に緑藻類･アオコなどの繁殖を抑える最新の湖沼浄化システムを説明する。本技術は日本では九州大学と共同で開発され、中国では上海同済大学と技術提携で中国の実情に適うシステムに研究されています。

POINT 1

KOYOH JAPAN

EBB has main functions

エコバイオ・ブロックの効果は二つに分ける

1.Decomposing Organic Matter

1. 有機物の分解

2.Odor Removal

2.悪臭除去

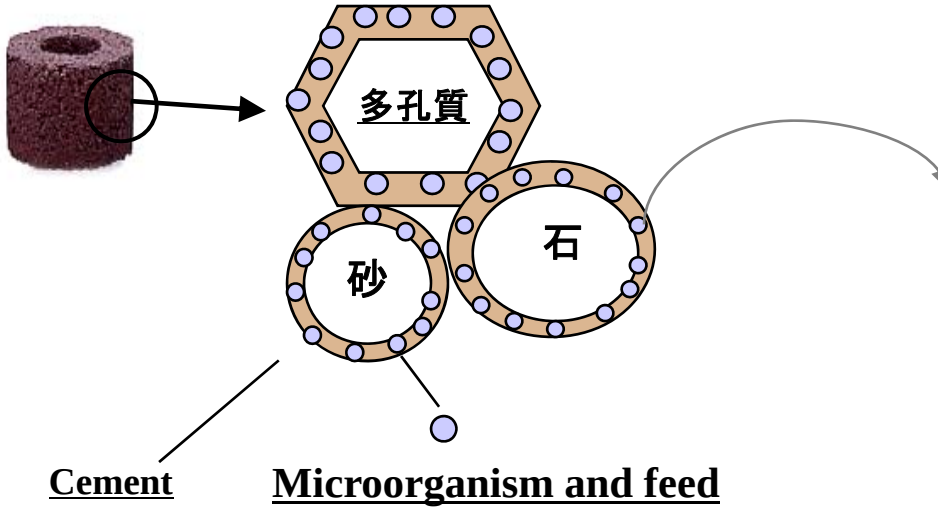
Reducing water changing frequency

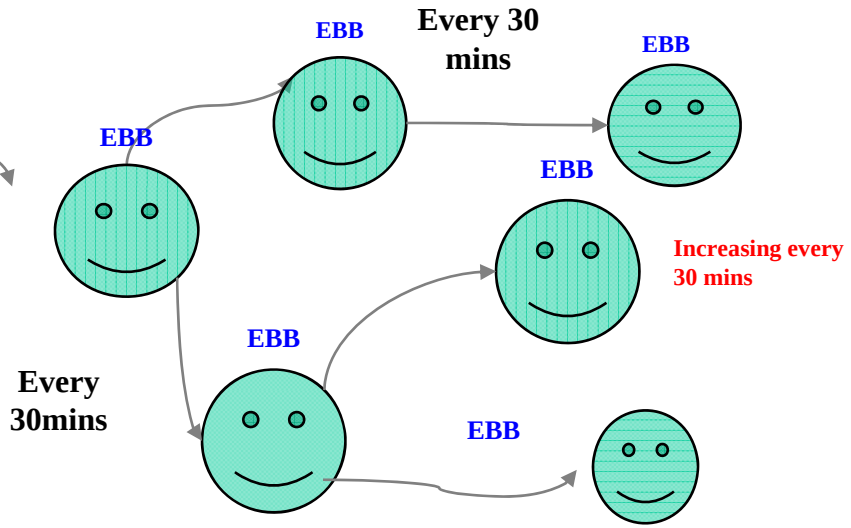
If you change 2/3 of the water in the 60L tank every week the result will be that 2 ton of water contain Ammonia and nitrate.

POINT 2

Immersing EBB in water Bacillus Natto will increase and purify water

ＥＢＢを水に入れると、浄化納豆菌が繁殖し、水を浄化する





POINT 3

Characteristic of the Microorganism

ＥＢＢを水に入れると、浄化納豆菌が繁殖し、水を浄化するブロックである

KOYOH JAPAN
eco-bio-block

Viable Temperature　：from minus to 110℃　not active under10℃

Range of the effective propagable temperature：10℃～65℃（Most effective temperature 25℃～60℃）

pH：pH3～pH11（Viable in strong acidic and strong alkaline）

SIRIM BIOTEST

TEST REPORT

Sponsor	MAMORU (M) SDN BHD	Technical initiation	29 March 2001
Address	No 18 Jalan U5/ 91P 47620 UEP Subang Jaya Selangor	Technical completion	30 March 2001
Contact	En Zainudin Idris	Report Date	2 April 2001
		Job Number	040/01

Test Article	Water sample	Study	Direct Contact Assay

REFERENCE: This study was based on the procedure and method described in British Standard (BS) 6920-2.5:2000 Suitability of non-metallic products for use in contact with water intended for human consumption with regard to their effect on the quality of the water – Part 2: Methods of test – Section 2.5: The extraction of substances that may be of concern to public health.

GENERAL PROCEDURE: The degree of cytotoxicity in a mammalian cell culture, CCL 81 Vero cells, in response to the test articles was determined. Validation solution (zinc sulfate) and a blank were included in the study to verify the proper functioning of the test system. The test articles, validation solution and blank were tested in replicates of six at the Neat concentration. The cultures were incubated at 37 ± 1 °C in a carbon dioxide incubator, and assessment carried out after 24-hour incubation through microscopic observation.

RESULTS:

Effects on culture	Validation solution	Blank	Test articles	
			Before treatment	After treatment
Monolayer	Dissociated	Confluent	Confluent	Confluent
Cellular damage/lysis	Positive	Negative	Negative	Negative

CONCLUSION: The test articles exhibited non-cytotoxic responses.

AUTHORIZED PERSONNEL:

Dr Md Anuar Osman, Ph.D
Consultant

Dr Siti Intan Mokhtar, Ph.D
Researcher

Testing Institution	SIRIM (Malaysian National Research and Testing Center
Testing Standard	British Standard 6920 and 2.5 Test by international standards in 2000
Testing Method	Verify by applying EBB solution directly into mammalian cells

Safety has been confirmed by the acute toxicity test and the survival rate examination by Japan Food Research Center
